

Chapter 1: Introduction to Disaster Management

1. Aim of Disaster Management

The main aim of disaster management is to reduce the loss of life, property, and environment caused by disasters through preparedness, mitigation, response, and recovery.

2. Relationship between Hazard, Risk, Vulnerability, and Capacity

- Hazard: A dangerous event like flood or earthquake.
- Risk: Chance of loss caused by hazard.
- Vulnerability: Weakness of people or property to disasters.
- Capacity: Ability to resist and recover from disasters.

Relationship: Risk increases when hazard and vulnerability are high, but decreases when capacity is strong.

3. Types of Disasters with Examples

Natural Disasters: Earthquake, flood, cyclone, tsunami.

Man-made Disasters: Fire, industrial accidents, war, pollution.

4. Principles of Disaster Management

- Preparedness
- Prevention
- Mitigation
- Coordination
- Community participation
- Quick response and recovery

Most important principle: Preparedness.

5. Dimensions of Disaster and Their Effects

- Social: Loss of lives and displacement.
- Economic: Damage to property and economy.
- Environmental: Pollution and destruction of resources.
- Psychological: Fear, stress, and trauma.

Chapter 2: Disaster Management & Planning

1. Nature of Disaster Management

Disaster management is continuous and multidisciplinary. It includes prevention, preparedness, response, and recovery.

2. SWOT Analysis in Disaster Management

- Strengths: Skilled rescue teams
- Weaknesses: Poor infrastructure
- Opportunities: Technology and government support
- Threats: Climate change and pandemics

3. Steps of Hazard and Vulnerability Analysis

1. Identify hazards
2. Collect data
3. Assess vulnerable areas
4. Analyze risks
5. Plan mitigation measures

4. Importance of Organizational Structure in DM

A proper structure improves coordination, communication, decision-making, and efficient response.

5. Importance of Team-Building in DM

Team-building improves cooperation, leadership, and emergency response.

Chapter 3: Disaster Mitigation

1. Concept and Types of Mitigation

Mitigation means reducing disaster risks and impacts.

- Structural Mitigation: Dams, cyclone shelters
- Non-Structural Mitigation: Awareness programs, policies

2. Importance of Fire Plan and Cyclone Shelters

Fire plans help safe evacuation.

Cyclone shelters protect people during storms.

3. Disaster Mitigation Strategies

- Hazard mapping
- Early warning systems
- Strong infrastructure
- Public awareness
- Environmental protection

4. Hazard Zoning

Hazard zoning identifies areas based on disaster risk levels.

5. Role of Team in Disaster Mitigation

Teams help in planning, rescue, and rehabilitation.

6. Importance of Information and Communication

Good communication helps in early warnings and rescue coordination.

Chapter 4: Disaster Preparedness

1. Importance of Disaster Preparedness

Preparedness helps reduce damage during unpredictable disasters.

2. Principles of Disaster Preparedness

- Planning
- Training
- Coordination
- Awareness
- Resource management
- Regular drills

3. Importance of Logistical Readiness

Ensures availability of food, medicines, transport, and rescue equipment.

4. Organizational Structure of Disaster Preparedness

Organizations:

- Government agencies
- Police and fire services
- Hospitals
- NGOs
- Community groups

Duties:

- Rescue operations
- Medical support
- Relief distribution
- Public safety

5. Importance of Contingency Planning

Contingency planning prepares actions before disasters occur.

Contents of Emergency Operational Plan:

- Emergency contacts
- Evacuation procedures
- Resource allocation
- Communication system
- Rescue and medical plans
- Shelter arrangements
